Camera features in Lightroom® 5 improve the way you work with your images. When you pick an image, along the right edge of your screen, you'll see a bunch of options. The first is the Import menu. Choose it to upload your images from "smart device" cameras, external storage, and your hard drive (Adobe bridge. The second built-in option is Export. This is where you create your new images. Use the New Image drop-down menu to create a JPEG, a TIFF, or a RAW file. Use a new feature called Export As that will convert your existing RAW images to JPEG or TIFF format, all in one easy step. Other ways to get your original images to the computer include Camera Raw and Packager. Camera Raw lets you easily make your own custom adjustments to your images and Packager allows you to create a new file from a group of images. I was using Lightroom 4.3 for 4 months when I decided to upgrade to Lightroom 5. It's not that I hated Lightroom 4.3, but I had been using it for so long, the new version seemed like an unnecessary step. So I spent the next month or so getting used to the new version. How did I do? I didn't need to learn to work differently. I packed the new Lightroom into an existing workflow and after a few weeks, I had no trouble adapting to the upgrade. Other software manufacturers are also incorporating AI features into their products. For instance, Lightroom Tips, an AI component of Lightroom, does things like create numbered batches for batch exporting and offers the ability to pick photos from a larger number of images. The only AI feature I didn't like was the Darkroom panel (which is designed for subjects such as black and white and grayscale), but that's basically because it doesn't work well.

Once you've processed your images in Lightroom, they're also ready for use in the Photo Print service, so you can print them or export them to other services like here, Dropbox, Instapaper, Facebook and Twitter for sharing to friends. The program's basic editing functions remain the same, but there are many ways to change the look of your photos. The use of Layers is a feature that was available in Adobe Photoshop Lightroom 5 that is unique to this version of the software. In Photoshop, you can also do more in-depth editing by using plug-ins, from sharpening to removing flaws. New Smart Guides support an array of different web formats, including decorative objects, gradients, shadows, shadows with rounded corners and edge guides on images. They are positioned at the top and bottom of the image frame to help maintain the relationship between the image and surrounding elements. These can be used as a guide to ensure images are consistently aligned to at least once around the edges for creating "perfect" proportions. Another great, new feature in Photoshop is the ability to create smart objects. Just like Flash, these assets are optimized for the web, and can be used to make CSS- based websites more interactive. Smart objects merge the best of Photoshop and design software, allowing users to mask objects, build shapes, create channels and apply a selection mask. Elements to create these objects include the Channels panel, Keylines, Gradient tool, Pen tool and Hatch brush smart objects, and the ability to be easily used on the web. Probably one of the most striking and impressive Photoshop features in the web version of the software is the introduction of live support and assistance within the software, which is via optional chat support. Using Live Support, you can chat with Photoshop designers and product experts around the world. And with some of the tools they use, they can show you the latest and best results of a subtle adjustment in your work. To enable live help for Photoshop, just download the free Adobe switcher and chat with a new brand of experts.
