Lightroom 5 is an easy and smooth upgrade, and it now lets you use older version of the Adobe Bridge UI across more products than ever before. Importing from RAW files is easy, and the editing tools have been updated to make adjustments to new features more intuitive. No question: Creates the same output file. However, version 5.2 beta (which will be released June 2013 along with the Photoshop CC upgrade) adds the option to save direct raw files, CURA external node images or to auto-convert DNG files into raw files based on the external node. The latter converts DNG files into a raw format that can only be processed in standalone raw conversion tools. The Lightroom version that will be released with this feature will be 5.2. First, the information column is missing. And second, the possibility to open a DNG file has been disabled in the new version of Lightroom (but it does show in Windows Explorer). In version 5.2 you can also save the images in raw, folder-based structure (like "swirlyPix"). It is possible to open a folder structure in the same way to make editing easier. You can also set the project file format to "ab" (as in the previous Lightroom version) to work with old projects in Lightroom 5.2. Raw Processing, Adobe's replacement for DPP, is the same as before. It currently has a 1.0 version that will later be converted to a full version. It still uses the same Exporter Technology as the previous version: DXO mark II. DXO mark II is a plug-in for Photoshop and Lightroom that allows to assign RAW (.DNG) files with valid and verified file data to one digital camera manufacturer in order to get a better representation of the ISO, white balance, sharpness or size of a camera's image. DXO mark can also be used to insert models, remove objects, retrieve available information.

Accordingly, CINEMA has created a few tips and tutorials to guide you on how to create cinemagraphs. A cinemagraph is an animated still image. It is a combination of an image and an animation. A still image typically represents a single moment in time and a single subject. On the other hand, the motion in a cinemagraph is added by the human eye to make it appear similar to a movie. Cinemagraphs are generally used in social media apps, like Instagram or Snapchat, or other websites, like Facebook or Twitter since they are one of the best ways to impress people. These apps hide the still images, instead inserting them as a video. This way, users see the effect of having a still image changed to an interactive one. It will be easy for them to share a cinemagraph.
