To develop and validate a brief, mobile phone based assessment of hand and upper extremity function in children with cerebral palsy. Computerized task specific tests were developed and embedded into a mobile phone application (app) used to collect data. Data were collected in two separate phases. In Phase 1, 60 children with cerebral palsy, aged 3-12years, participated. Test-retest reliability was measured in 30 of these children. Phase 2 involved 20 children with cerebral palsy, 12 children with typical development and 18 parents. Analyses of Phase 1 data showed that test-retest reliability for most subscales of the app was excellent (Intra-class Correlation Coefficient: 0.8-0.99) except the grip strength and finger-thumb pinch subscales which showed fair to good reliability (Intra-class Correlation Coefficient: 0.4-0.8). Phase 2 data suggested the app was easy to use and provided useful data for assessing motor function. The mobile phone app was a practical and well
