Round table discussion on patient safety. a non-profit, public benefit corporation.GOTZ, 2009). POSTTRAUMA EMOTIONAL DEPENDENCE.Phenotypic analysis of neutrophils from mice with selective impairment of activation of the nuclear factor-kappa B. The nuclear factor-kappa B (NF-kappaB) is a transcription factor important for regulating the expression of many cytokine genes, including those coding for the cytokines IL-1 and TNF-alpha and the chemokines MIP-1alpha, MIP-2, and KC. To investigate the function of NF-kappaB in neutrophils, we disrupted the gene for the p50 subunit of NF-kappaB. Disruption of the p50 gene has no effect on the production or release of IL-1 and TNF-alpha by peritoneal macrophages, but interferes with the activation and production of the chemokines MIP-1alpha, MIP-2, and KC by neutrophils. The neutrophil defects were evident in both the basal and stimulated states, although maximal cytokine release was slightly higher in the p50-null cells. The p50-null neutrophils responded normally to low concentrations of stimulants. Neutrophils from p50-null mice infected with Salmonella typhimurium produced normal levels of IL-1 and TNF-alpha, but both neutrophils and mac c6a93da74d
