Now that the big news about the release of Creative Cloud has been settled, let's talk about the software updates for this version of Photoshop. After all, the updates don't affect the user interface; they are about the technical workings of the software and hence, we should start with the topic of expected improvements. Perhaps the most obvious feature is the implementation of a new, simplified UI that focuses mainly on adjusting color. You no longer have to remember clicking "RGB", "Red", "Green" and "Blue" separately. You are able to work with color values as a group. There is a "Recolor All" button that lets you quickly after making adjustments to its surrounding areas. The color range is even more intuitive than before. Black boxes are used for demonstrating the effect of each slider, so you are more likely to understand the result of your adjustments. Additionally, you can quickly access the native CMYK to RGB option, which provides a good reason for Adobe to not disable this functionality completely. But most importantly, the new update surprisingly enables you to work with the filmstrip view while using the DNG (Digital Negative) or TIFF format. Another feature that was inspired by Lightroom is the new Liquify tool, which allows you to create some impressive effects with the brush tool. This feature was previously

available in previous versions of Photoshop, but now it's built directly into the program. The Liquify brush is a great tool for painterly effects.
