**-RELATED gene family:** Mutations in this gene lead to severe mental retardation. The mutation of this gene in zebrafish induces patterning defects, leading to the degeneration of cranial ganglia and asymmetric differentiation of hindbrain. The homeobox superfamily is a large and growing superfamily of proteins that play critical roles in determining cell fate during embryonic development. Examples of homeobox proteins are transcription factors. Proteins in this family are characterized by a 60-amino acid homeobox that mediates sequence-specific DNA binding and by a second DNA-binding domain of variable length. This gene is a member of the HN1 homeobox gene cluster on chromosome 11p15.5. Alternate transcriptional splice variants, encoding different isoforms, have been characterized for this gene.
