Adobe is making Elements better on every version as well. This time around, some of the most interesting new features are the ability to edit stars, add stars with a slider, and resize stars automatically. Stars can be edited by drawing with an appropriate tool, or by learning to edit the star info. The stars you learn to edit are shown in the inspector above the image window and allow you to easily change the size of all stars. You can also resize and reverse the direction of star edges. If you also like to create content, you know that light table illustration is big business. Adobe has always been slow to add a solution to it, and even now many of the once notable techniques are still tedious to use. Gradient overlay, clipping masks, and layer masks—these are things that you have to work on rendering and arranging multiple times to make very useful. But for me the highlight of Photoshop 2010 was that it finally adopted the Illustrator process for creating a light table. Now, when I'm creating a table for a client, I end up creating the entire piece in Photoshop, exporting it to Illustrator, then loading it into Photoshop as a Photoshop-only asset. This allows for the project to be a Layer-based rather than a Document-based asset. Exporting and restoring to the PSD document remains a cumbersome and tedious process. I carried around a PSD file filled with images of different shapes and sizes that I needed for this project, just so I could continue working on them. I end up switching back to my Lightroom file and restarting on that. As you can imagine, this is not necessarily convenient. Since the advent of the **Apple Pencil**, this is even more inconvenient. I'd love to see the two tools work together in a clean and natural way, so that you can go full-screen and work, but still be able to directly draw on top of the Photoshop asset you're working on. Let's go back for a moment to PS7 lets you design PSD files up front, and then immediately export them to native Photoshop layers without having to convert layers to actual documents. The problem is that the PSD file is only a dictionary of information and not actually a rendering of the final document. This is friggin' awesome, but Photoshop is 30 years late. With the advent of the **Adobe Photography Settings** panel, we lost some of the wonderful features of Camera Raw, and even in the darkroom we had a hidden feature called Photo F/X. Perhaps Photoshop needs to carry some of what Lightroom has in its Panel utility, but lets face it: Photoshop has no use for a full-featured panel that can do all of the things a Lightroom Panel can do.
