For Venezuela, CADIVI is required.Spectrum, Correlation, and Coherence in Acoustic Radiation for Acoustic Microcavities. The properties of spontaneous and evanescent radiation from a membrane oscillating in an acoustic microcavity are investigated. The radiation is analyzed from the acoustic point of view, specifically from the spectrum, correlation, and coherence with the membrane. The membrane response is modeled by a temporal filter, which is composed of the Fourier coefficients of a

certain shape function. The filter is the convolution of two different functions, a high-frequency rectangular bandpass filter and a low-frequency exponential filter. The spectrum of the convolution between these two filters is analyzed in detail, and analytical results are compared to numerical simulations. The spatial correlation between the spontaneous and evanescent modes is obtained and analyzed, and a good agreement between theory and simulations is found. The coherence function of the radiation is studied as a function of the cavity size. The results obtained in this work are very useful for future experimental observations of cavity resonances and the nonlinear radiation.The invention relates to power transmission and distribution systems and, more particularly, to switchgear for such systems. Power distribution systems include three basic types of switching devices: circuit breakers, reclosers, and transfer switches. Circuit breakers and reclosers are the most commonly used switching devices. Circuit breakers are used to isolate segments of a power distribution system

(typically part of a substation) from one another when the system is in an abnormally high load condition, such as during a power outage. Reclosers are used to reenergize loads after a power outage, while transfer switches operate to switch the electrical power to a new power source. Conventional circuit breakers and reclosers each include a separable set of arcing contacts. When the arcing contacts are closed and a fault occurs in the power distribution system, the circuit breaker or recloser, for example, can apply a large force to separate the arcing contacts. To withstand the large forces, the circuit breaker or recloser is relatively large and heavy. Because they are relatively large and heavy, circuit breakers or reclosers can be difficult and/or expensive to install. For example, they can be difficult to install
