Proton Transfer Oligomeric Nanosheets Formed by Strong Hydrogen Bonds and Weak C-H···O Hydrogen Bonds. We found that the strong C-H···O hydrogen bonds (H···O) in 1,3,5-tris(4-methylphenyl)benzene (TMPB) and the weak C-H···O hydrogen bonds (H···O) in formic acid (FA) can be formed as discrete single-layered nanoparticles (PLNs), which are proton transfer oligomers via C-H···O hydrogen bonds (H···O). The particle size of the PLN particles is around 1.7 nm. We also prepared double-layered nanoparticles (DLNs) of the two types of hydrogen bonds with a particle size of around 12 nm. The single-layered nanoparticles (NPs) were further centrifuged. The proton conductivity of the single-layered nanoparticles (PLN and DLN) prepared by the centrifugal method was $1.33 \times 10(-6)$ S/cm, which was higher than that of the proton transfer NPs reported previously. Vascular ultrasonography in an Italian hospital: its use as a first-line diagnostic tool in different clinical situations. The aim of this prospective study was to evaluate the accuracy of vascular ultrasonography (US) in diagnosis of carotid stenosis as a first-line diagnostic tool in a tertiary care hospital in Italy. A total of 237 patients were prospectively evaluated, using US and digital subtraction angiography (DSA), for carotid stenosis, based on ultrasonographic criteria. In 190 patients, carotid US was normal, whereas in 47 cases vascular US was considered negative because no stenosis was observed by US. DSA was performed as a "gold standard" test in 51 (22%) of the patients and as a "complementary" test in 26 (11%) of the patients. The sensitivity, specificity, positive and negative predictive value, and likelihood ratio (LR) for carotid US were 94.8%, 100%, 100%, 86%, and 8.7, respectively.

Q: How to convert longitude and latitude from one coordinate system to another I have a converted coordinates: x = 8.679426 y = 73.14007 The second line is the longitude in degrees, and the third is the latitude in degrees. I have some calculations with this data. I'll use the formula where s0 is the equator in degrees and p is the polar coordinates: $s0 * \sin(p) = x*\cos(p) + y*\sin(p)$ Now, I have a coordinate system which the longitude and latitude is in radians, and I want to convert it to degrees: s0 = 0.0174533 p = 7.569879 How can I convert $s0 * \sin(p)$ to a format where I can do my calculations? A: Let $x = x*\cos(p) + y*\sin(p)$ and, $y = x*\cos(p) - y*\sin(p)$. With the s0 and p you have, the following identities are true: $x*\sin(p) = x*\cos(p)*\cos(p) + y*\cos(p)*\sin(p) = \cos(2p)$ $y*\sin(p) = x*\cos(p)*\sin(p) + y*\cos(p)*\cos(p) = \sin(2p)$ So the only thing you have to do is to replace p by 2p. You could do all the calculations with the radians and then convert it, but it is a bit of an overkill. In an October 26 article, the journal Nature wrote that a newly discovered virus may have been responsible for the 1918 Spanish flu pandemic. The authors, led by Paul Turner from the University of East Anglia, studied newly sequenced viral genomes from samples of influenza collected from Spanish soldiers during the Spanish flu pandemic and those who survived the pandemic and from 1918. They found the Spanish flu virus in the genomes of samples collected in 2009 from those who had survived the pandemic. The virus may have survived in these soldiers and then re-emerged at some point in the past and then survived in Gen. Humberto Figueroa, an important Spanish flu researcher and expert on the virus who died in 2010, confirmed that this virus was found in soldiers living
