Interoperability The DXF file format is a true international specification, which allows interoperability between applications. This means that a DXF file can be read by any CAD application and applied with the same results. Although the DXF standard was adopted as an ISO standard in 1988, software developers can create their own software-based extensions to the standard. There are many software applications that can be used to edit, modify and modify the DXF data in a number of ways. Some of the ways of modifying the DXF format include: Allow the addition of comments, layers, text and bitmap images. Allow layout of the drawing to fit on various pages of a paper size. Allow the rotation of design elements 90 degrees from their default orientation. Allow the insertion of text and images within the drawing environment, including on other layers. Allow the addition of text, symbols and 2D images to a DXF drawing. DXF is the basis of the DGN file format, which is used to represent 2D and 3D data of building designs, such as for architectural models. DGN is used mainly for architectural applications, but is also the basis of other design applications, such as Mechanical and Electrical Design, Structure Analysis, Civil 3D, Product Lifecycle Management (PLM) and others.
